

In-Class Exercises #1

All students set up their own laptop computers to work on the projects, assignments, and the remaining in-class exercises.

1. Follow instructions in `SoftwareInstallation.pdf` and set up the Java programming environment with Eclipse.
2. Under the project `Comp8490**` created during installation, create a package in the name of `Codes**84900`, where `**` needs to be replaced by the initials of your first and last name.
3. Create a class in the name of `RotatingCube`. Copy the codes from the attached `RotatingCube.java` and paste to your file.
4. After making the program working as described in **Step 5(h)** on page 5, demonstrate your work if you has finished the exercise before or in class. Alternatively, submit a video online to demonstrate your work.
5. In the submission box on Brightspace, write down the time when you finish your work.
