

In-Class Exercises #4

The zip file of Files4Lab4.zip contains two java files.

1. Within your package Codes**8490, create two files in the same names as the provided files and replace XY with your initials.
 - The provided code follows a scene graph as shown in the left figure below.
 - Running your program should produce a disk shape as shown in Fig.(a), which consists of the ring-shaped side surface and one circular surface, with the other circular surface missing.
 - When menu item **Disk** is selected, a gap or no gap shows up between the two surfaces.
2. Modify your files to produce the result as described below.
 - (a) The program starts by displaying a closed disk shape with its missing circular surface being attached and without any gap between surfaces. The new circular surface appears the same as the provided circular surface but is in a different color of your choice.
 - (b) When menu item **Disk** is selected as shown in Fig.(b), both of the two circular surfaces shift away from the side surface and display in sequence a small gap in a distance of 0.25, a medium gap in 0.5, or a big gap in 0.75. After reaching the biggest gap, another selection of menu item **Disk** make the gaps disappear, i.e., showing no gap.
 - (c) In addition, a selection of menu item **Disk** results in an update of the frame title to indicate the type of gaps.
 - (d) Make your program easy to comprehend by adding adequate amount of comments.
3. Locate the folder that contains all files of your project Comp8490; produce a zip file of your project folder; and submit it online before due.
